

Data Indexing

Unlock your SDSs to extract an extensive network of data.

The foundation of SiteHawk Communicator's is a robust indexing process. SiteHawk provides indexing at initial implementation as well as part of an ongoing service to help customers utilize the latest chemical data. Once a new or updated SDS is received, SiteHawk experts professionally evaluate each SDS and extract up to 240 data points associated with the material. This data powers system functionality such as search, reporting, labeling, inventory tracking and material approval tools.

SiteHawk's quality assurance process ensures you have access to accurate, up-to-date data. When an SDS is submitted, SiteHawk engages a combination of double-blind keying, statistical process control and special exception handling in an effort to maximize data quality. Leveraging over 20 years of experience in managing chemical data, SiteHawk utilizes these processes when an SDS is received and throughout the indexing process to deliver trustworthy, verified content and help your organization elevate data beyond compliance—to drive operational excellence.

- ✓ Unlock SDS data to utilize reporting, search, tracking and supply chain tools.
- ✓ Export chemical data and integrate disparate systems.
- ✓ Leverage extensive trustworthy content and reduce administrative overhead with automated indexing for every new or revised SDS.
