

Full Formula Ingredients

SiteHawk helps leverage your chemical data to maintain compliance, reduce risk and drive stewardship initiatives. SiteHawk Communicator's 8.6 release includes innovative functionality for environmental and stewardship teams that utilize advanced ingredient data. Full Formula Ingredients, also known as Full Disclosure or Proprietary Ingredients, provides the ability to track comprehensive full formula ingredient data within SiteHawk. Users with given permissions can view and manage full formula ingredient data centrally stored in corporate catalogs; formula data can be viewed and edited at the corporate level or by approved facility users.

Full Formula is distinct from SDS data and augments existing ingredient information. Full Formula is user-managed within Material Summary pages. Information such as date ranges, documents and comments can be attached to Full Formula data. In addition, multiple formulas can be stored for any material with one formula designated as primary. The flexibility and security of SiteHawk's Full Formula Ingredients enables your organization to store proprietary or company-specific full formula ingredient data with configurable access for all employees.

- ✓ Store and track multiple ingredient formulas over the lifespan of a material at the corporate or facility level.
- ✓ Manage Full Formula Ingredients, attachments, date ranges and comments in Material Summary pages.
- ✓ Secure proprietary ingredient data by managing permissions and access to Full Formula Ingredients.
