

VERSION COMPARE

Identify and evaluate the changes in SDS updates.

Manufacturers, suppliers and distributors are responsible for providing current, accurate and compliant SDSs to their buyers as documents are updated. But how do workplaces know what updates were made from previous versions? Let SiteHawk show you!

The Version Compare tool in SiteHawk Communicator enables users to easily identify changes in SDS versions over time. Simply select two versions to compare and examine the highlighted differences. This comparison tool can be used for any two versions of a document. Users can track changes over the lifecycle of a material and plan for chemical process changes or use impact (such as updates to hazard communication policies, chemical approval processes and stewardship practices).

In addition, Version Compare can be utilized to identify Additional Properties or custom identifiers that should be updated or added. By tracking identifiers over different versions, users can ensure compliance with business and contractual requirements.

- ✓ Identify changes in SDS documents to utilize the most current data and implement effective safety procedures.
- ✓ Update Additional Properties ensure current and accurate custom identifiers for materials.
- ✓ Track changes in a material to evaluate impact analysis or manage internal process changes.
